

# *UniPak* 950-0099-005

REV N MAY 83

10-950-0099

Copyright © Data I/O Corporation, 1983. All rights reserved.

#### **FOREWORD**

Before using the -005 version of the UniPak, read the information in this section to be sure your programmer does not require a modification. Either or both of two modifications to your System 17 or 19 may be required for compatibility with the -005 or later version of the UniPak:

- A. It may be necessary to make a small hardware modification to the System 17/19 Controller (702-1520).
- B. A firmware update may be necessary.

29A Universal Programmers and 100A Production Programmers may need a firmware update.

#### A. HARDWARE MODIFICATION

System 19s with serial numbers below 1516 and System 17s with serial numbers below 219 will require a small modification for use with the UniPak. The UniPak may cause invalid error messages if the modification is not made. No other programmer functions are affected, nor will attempting an operation harm the programmer, the UniPak, or a device in the socket.

#### **CAUTION**

The following hardware modification to the System 19 and 17 should be performed by a qualified technician only. If the facilities are not available to perform the modification, contact your local Data I/O Service Center listed below to arrange for return of the programmer to Data I/O for modification.

#### **MODIFICATION INSTRUCTIONS**

- 1. Unplug power cord.
- 2. Remove Programming Pak.
- 3. Remove protection shield.
  - a. Pull the two snap-lock connectors and lift them gently.
  - b. Lift the back edge of the plate first and pull it up slightly and turn it to the left until it is clear.

- 4. Remove top cover.
  - a. Turn the programmer on its top.
  - b. Remove the 4 cover screws.
  - c. Turn the programmer upright and lift the cover off.
- 5. Remove display panel.
  - a. Remove 4 screws located at the corner of the display panel.
  - b. Remove the screw fastening the support bracket to the power supply assembly.
  - c. Remove the screw fastening the support bracket to the front of the base.
  - d. If there is a screw fastening the support bracket to the bottom plate, remove it.
- 6. Refer to Figure 1. Sever the trace connecting R66 to U41 pin 1 just above R66 (left side).
- Install an insulated wire from the top side of R58 (just left of C29, in front of the Programming Pak connector) to U41 pin 1. To connect to U41 pin 1, use the feed-through hole on the trace tying R66 to U41. (See Figure 1.)
- 8. Reinstall the display panel top cover and protective shield by reversing the removal procedures.

#### PROGRAMMER CHECK

- 9. Install a Programming Pak.
  - a. Check the programmer for proper initialization.
  - b. Load a device with a known data pattern and perform a verify to confirm proper operation.

#### **B. SOFTWARE UPDATE**

Some programmers require a software update for compatibility with the -004 or later version of the UniPak. Table 1 shows the revisions and software-configuration-check numbers for each programmer configuration requiring a software update. If your System 17 or 19, 29A or 100A is of one of these revisions, contact a Data I/O Sales Representative to order the appropriate update kit.

To determine the revision level of a programmer, use the procedure below to display the software configuration-check number and compare it to Table 1.

- System 19 and 29A, all configurations. Key in Select Code B2-START.
- 100A Production Programmer. Key in Select Code 10.
- System 1730. Enter remote control and use the G command.
- System 1731. Enter remote control and use the CN command.

a. Before Modification.

b. After Modification

Note: Your Controller may appear slightly different. Be sure connections are made to the components designated in this bulletin.

Figure 1. Jumper-Wire Location on Programmer Controller, 702-1520.

#### NOTE

This configuration of the UniPak varies from previous configurations in that it uses some hexadecimal family codes. No decimal family numbers have been changed. While this configuration will work with any Data I/O Universal Programmer (see Section 1.1), to use hexadecimal families it may be necessary to update your programmer. Refer to the foreword section of this manual for maintenance compatibility requirements. Model 1730's cannot handle hexadecimal families at this time. Some of the new larger devices will require that the programmer RAM be expanded. Consult your nearest Data I/O representative for update availability.

## SECTION 1 INTRODUCTION

#### 1.1 GENERAL INFORMATION

Data I/O's UniPak reliably programs over 400 different popular MOS and bipolar devices. By generating programming signals under software timing and routing control, the UniPak eliminates the need to change hardware for different devices.\* A 2-digit Family Code and a 2-digit Pinout Code select all the necessary conditions for each device within the UniPak's repertoire. With codes selected, the UniPak illuminates the LED of the appropriate socket.

The UniPak can be used in System 19s, 29A Universal Programmers, and Model 100A Production Programmers of any configuration and in System 17s with remote control (see note page i).

#### 1.2 APPLICATIONS

Table 1-1 is a complete list of devices within the capability of the UniPak at the time this manual was published. In many cases when a new device with industry-standard pinout is introduced within a manufacturer's family, the UniPak will not require any revision. For some new applications, such as to accommodate a new device family, a software update of the UniPak may be required. The revision letter is stamped after the part number (950-0099) along the underside of the top edge of the UniPak socket assembly. Data I/O Field Bulletins give information on updating equipment.

#### 1.3 SPECIFICATIONS

The UniPak receives its power from the programmer. Programming waveforms are generated from raw programmer supplies using regulators controlled by the programmer's microprocessor. The controlling software is located on a separate circuit card within the UniPak.

Table 1-2 lists the physical and environmental specifications of the UniPak.

### 1.4 ORGANIZATION OF THE PROGRAMMING ELECTRONICS

The UniPak is designed to adapt to the programming requirements of several device families.

Pinout variations are handled by the 7 device sockets on the UniPak; specially designed electronic switches allow programming of both bipolar and MOS devices in the 24-pin socket (number 2).

In order to maximize control speed during programming, the UniPak makes extensive use of addressable latches for control signals. For flexibility in waveform generation, digital-to-analog converters (DACs) control all major power supplies, with several rise and fall times selected by software.

Values for programming variables, including pinouts, voltage levels and timing, are stored in software tables. When the operator chooses the Family and Pinout Codes

for a particular device, the programmer uses information in these tables to assemble a specialized programming routine in scratch RAM. This method allows high-speed operation with minimum software.

#### 1.5 CALIBRATION

The need for calibration varies with the amount of use. Generally, we suggest calibration whenever programming yields fall below the manufacturer's recommended minimums.

The UniPak can be calibrated only on a programmer that has an address and data display; UniPaks used with a System 17 programmer must either be calibrated on another programmer or sent to a Data I/O Service Center.

#### 1.6 WARRANTY

Data I/O equipment is warranted against defects in materials and workmanship. The warranty period of 90 days begins when you receive the equipment.

The warranty card inside the back cover of this manual explains the length and conditions of the warranty. For warranty service, contact your nearest Data I/O Service Center.

#### 1.7 SERVICE

Data I/O maintains Service Centers throughout the world, each staffed with factory-trained technicians to provide prompt, quality service. In addition to repairs, all Data I/O products are calibrated. A list of all Data I/O Service Centers is located in the back of this manual.

#### 1.8 ORDERING

To place an order for equipment, contact your Data I/O sales representative. Orders for shipment must contain the following information:

- Description of the equipment (See the latest Data I/O Price List or contact your sales representative for equipment and part numbers.)
- Quantity of each item ordered
- Shipping and billing address of firm, including zip code
- Name of person ordering equipment
- Purchase order number
- Desired method of shipment.
- \* As of the -004 version, several adapters will be available to program several nonstandard pinout devices.

#### **KEY TO HEADINGS**

- Device Part Number. The part number assigned by the device manufacturer.
- Family Code. A 2-digit number that designates the programming algorithm.
- Pinout Code. A 2-digit number used to differentiate device types based on pin assignment and array size.
- UniPak Revision. A number in this column specifies the earliest software version of the UniPak that will program the device to the manufacturer's latest specifications.
- Socket Adapter. Model number of the socket adapter that programs the device. If a number does not appear in this column, use the fixed 28-pin front panel socket to program your device.
- Socket Adapter Revision. Indicates the earliest revision of the socket adapter that will program the device.
- Notes. The following is an explanation of the letters that appear in the Notes column.
  - O This device is obsolete and no longer in production
  - P This device is currently in production. Data I/O has a written manufacturer approval for this device's programming algorithm.
  - Programming algorithm for this device is installed within the programmer; manufacturer approval has been requested.

Table 1-2. Specifications

Weight	1.38 kg (3 lb5 oz.)	Operating-Temperature Range	0 to 40 °C (32 to 104 °F)
Dimensions	20.9 cm x 17.0 cm x 10.5 cm (8.2" x 6.7" x 4.2")	Storage-Temperature Range	—40 to 55℃ (—40 to 131℉)

## SECTION 2 INSTALLATION

#### 2.1 INSPECTION

The UniPak was tested both electrically and mechanically before it was shipped, and was carefully packaged to prevent shipping damage. It should therefore arrive free of any defect, without marks or scratches, and in perfect operating condition. Carefully inspect the instrument for any damage that may have occurred in transit; if you note any damage, file a claim with the carrier and notify Data I/O.

#### 2.2 ASSEMBLY AND DISASSEMBLY

The top cover and card carrier normally remain attached, but for calibration they detach as shown in Figure 2-1. To reattach them, insert the flanges on the upper edges of the top cover and card carrier into each other. Then press them together and tighten the captive fasteners.

The UniPak is mounted on the programmer in the same way as a standard Programming Pak. If a Programming Pak is installed, remove it by pulling the handle to separate the mating connectors and then lifting it out.

Figure 2-1. Interconnection of the Top Cover and Card Carrier

#### 2.3 INSTALLING THE UniPak

#### CAUTION

Be sure that all sockets are empty when installing or removing the UniPak.

Install the UniPak by inserting the flange on the top edge of the UniPak around the top edge of the opening and pressing firmly to ensure mating of the connectors on the two units.

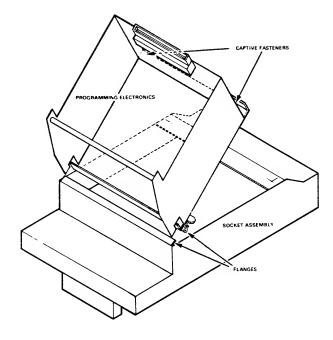

Figure 2-1. Interconnection of the Top Cover and Card Carrier

#### 2.4 REPACKAGING FOR SHIPMENT

If the UniPak is to be shipped to Data I/O for service or repair, attach a tag to it describing the work required and identifying the owner. In correspondence, identify the unit by serial number, model number, and name.

If the original shipping container is to be used, place the UniPak in the container with appropriate packing material and seal the container well with strong tape. If some other container is used, be sure that it is a heavy carton, wrapped with heavy paper or plastic; use appropriate packing material and seal well with strong tape. Mark the container "DELICATE INSTRUMENT" or "FRAGILE."

## SECTION 3 OPERATION

#### 3.1 INTRODUCTION

This section explains steps in preparing the UniPak for operations with a particular device.

#### CAUTION

Follow the procedures in this section carefully to avoid damage to the programmer, the UniPak, or devices to be programmed.

#### 3.2 POWER-UP

Install the UniPak according to the procedure in section 2.3. On power-up, the programmer performs an automatic self-test routine, signalling you when it is functional. Each programmer signals readiness in a different way; consult your programmer manual.

The UniPak may be installed and removed with the programmer's power on. This feature allows you to retain data in RAM during equipment changes.

#### **CAUTION**

Voltage transients can cause damage. Be sure that all sockets are empty when:

- 1. switching power on or off
- 2. installing or removing the UniPak

#### 3.3 DEVICE SELECTION

With the UniPak, device selection must always precede device-related operations. Any device in the UniPak's repertoire is specified by a unique combination of a 2-digit Family Code and a 2-digit Pinout Code. Once the codes are entered for a particular device, the UniPak remains adapted for any operation with that device until new codes are entered.

Your programmer manual will tell you where in the key sequence the Family and Pinout Codes should be entered. If unacceptable Family and Pinout Codes are entered, a beep will sound as either START or ENTER is pressed; the operation will be stopped.

#### 3.4 SELECT FUNCTIONS

Extended Select Functions CE and CF are used to set the reject count — the number of programming pulses applied to a fuse before it is rejected.

- CE sets the commercial reject count. This is the default value.
- CF sets the single pulse reject count.

#### NOTE

This feature was accomplished in previous configurations of the UniPak by adding 50 to the commercial Family Code.

 EF displays the configuration number of the UniPak software.

Consult your programmer manual for the key sequences for entering Select Functions.

#### 3.5 DEVICE INSERTION

Once the appropriate Family and Pinout Codes have been chosen, the UniPak is ready to accept a device in the socket indicated by the illuminated LED.

#### CAUTION

- Do not insert a device into a socket if the socket LED is not illuminated.
- 2. Never insert more than one device in the UniPak.

A good electrical connection between the device and socket is essential. Insert the device in the socket with the lever in the upright position, ensuring that pin 1 is aligned with pin 1 of the socket. Lock the device in the socket by pushing the lever down.

#### **CAUTION**

Never insert or extract a device when the START light is on.

#### 3.6 LOAD, PROGRAM AND VERIFY

Once the Family and Pinout Codes have been entered, the UniPak is ready for device-related operations. The codes remain in effect until they are changed or until power is removed. Load, Program, and Verify operations may be executed normally.

During each operation, the UniPak performs automatic parametric tests of the device. Tests, consisting of comparisons of the device data and RAM data, are performed at various Vcc levels, output-sink currents, and output-level-sense voltages, according to specific manufacturers' requirements.

In the Load mode, the nominal Vcc level, with a 1.6 mA current source on each output, is applied to the device. The sense threshold is 1.6 volts.

In the Program mode, illegal bit tests and blank checks are performed at nominal Vcc and with nominal output loading. Programming is done according to manufacturer's specifications. The first- and second-pass verifies are performed at parametric levels indicated in steps 15 and 16 of the Measurement Chart, respectively.

In the Verify mode, the two verify passes are done in the same way.

#### NOTE

Valid Family and Pinout Codes must be in effect to use the System 19 DEVICE DATA key. When the DEVICE DATA key is pressed, either nominal, first-pass, or second-pass verify levels are applied to the device. The level applied depends on the 19's position in executing the selected mode. If the KEYBD light is on, the nominal verify level is applied.

## SECTION 4 CALIBRATION

#### 4.1 INTRODUCTION

Calibration of the UniPak is recommended whenever programming yields fall below the device manufacturers' minimum specifications.

Calibration consists of 3 parts:

- Power Supply Calibration. These are measurements of the DC supply voltages of the programmer. All other voltages depend on these supplies; therefore, this part must be done first.
- DC Calibration. This consists of measuring and adjusting other critical DC voltage levels generated by the UniPak.
- Waveform Observation. Programming waveforms can be observed on an oscilloscope for compliance with the device manufacturers' critical voltage and timing specifications.

A performance check can be done to determine if your UniPak requires a complete, three-part calibration. The performance check consists of performing the tests noted on the Measurement Chart in order. Some tests, as noted on the chart may be skipped. If the performance check yields voltages within the specified range, all supplies and drivers will have been tested and the UniPak is ready for programming. During a performance check, the UniPak can remain installed as for normal operation.

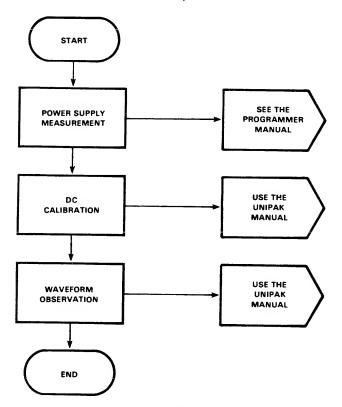

Figure 4-1. Calibration

#### 4.1.1 USE OF THE MANUAL IN CALIBRATION

Because of the different possible combinations of programmers and programming modules, this manual does not attempt to cover all areas of calibration. Instead, it lists the steps necessary to calibrate the UniPak. For information on how to carry out these steps on various programmers, consult the programmer's O & M manual. The programmer manual will be used for Part 1 of calibration, and this manual for Parts 2 and 3. See Figure 4-1.

#### 4.1.2 REQUIRED EQUIPMENT

The following equipment is necessary to calibrate the UniPak.

- Data I/O Calibration Extender, part number 910-1521
- Digital Voltmeter (Fluke 8000A or equivalent)
- Dual-trace Oscilloscope (Tektronix 465 or equivalent)

Check the appropriate programmer manual for any additional equipment that may be necessary to calibrate the programmer.

#### 4.2 THE MEASUREMENT CHART

The Measurement Chart contains the information necessary for all DC calibration tests. The information is presented as follows:

- The STEP NO. column tells which step to use for each test. Step numbers are set at the programmer keyboard.
- The TEST NO. column identifies individual tests.
- The TEST DESCRIPTION column identifies the functions being tested.
- The TEST LOCATION column tells which socket pins or test points to probe for measuring voltages.
- The VOLTAGE columns specify allowable voltage ranges. If a reading falls outside the range and you cannot adjust it to within the range, do not use the UniPak until the problem is corrected.
- The ADJUSTMENT LOCATION column tells which potentiometer to adjust if a voltage is out of range.
- The COMMENTS column gives special instructions for particular tests.

#### 4.3 CALIBRATION PROCEDURE

The following paragraphs describe how to calibrate the UniPak.

#### 4.3.1 POWER SUPPLY MEASUREMENTS

Follow the procedures for power supply measurements in the appropriate programmer manual.

#### 4.3.2 EQUIPMENT SET-UP

Set-up the equipment according to the following procedures. Figure 4-2 shows the calibration set-up.

- 1. Turn power off.
- Remove the UniPak from the programmer by lifting the handle gently, separating the mating connectors, and then lifting it out.
- Unscrew the 2 captive fasteners located on the underside of the top cover; they connect the UniPak to the top cover. Separate the 2 parts of the assembly.

#### **CAUTION**

Do not let the fasteners short to the Motherboard. (part number 702-1999)

 Insert the Calibration Extender the same way as the UniPak, being sure to seat it properly in the programmer's mating connector. Insert the 64-pin connector of the UniPak into the mating connector on the Calibration Extender.

#### 4.3.3 DC CALIBRATION

DC calibration procedures are as follows:

- Install the UniPak as described in section 4.3.2 and power up.
- 2. Put the programmer into the calibration mode as described in the programmer manual.
- Follow the steps on the Measurement Chart in order.
   Voltage readings are made at the device sockets.
   Figure 4-3 shows pin numbers for these sockets.
- 4. Adjustment pots are located on the Waveform Generator and Address Cards. These pots are accessible when the UniPak is installed in the Calibration Extender. Figure 4-4 shows the location of these adjustment points.

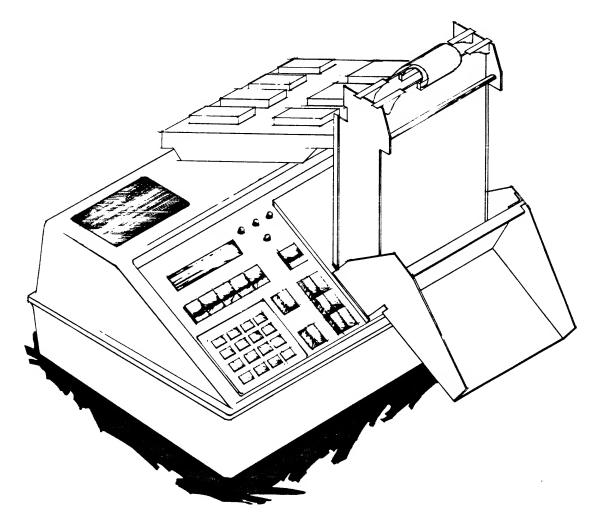

Figure 4-2. Calibration Set-up

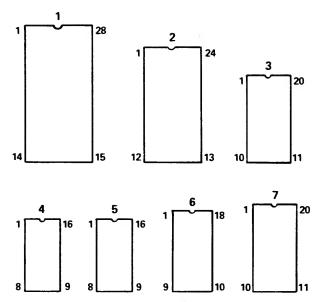

Figure 4-3. Pin Numbers of Device Sockets

#### 4.3.4 OPTIONAL VERIFY-VOLTAGE CHECKS

Two calibration steps, 15 and 16, have been provided for the measurement of first and second pass verify voltages. The Measurement Chart defines the levels for first and second pass verifications for each family. These are provided for the investigation of yield problems; no adjustments are available. Under normal circumstances, these steps can be eliminated from a routine calibration.

#### **4.4 WAVEFORM OBSERVATION**

Programming waveforms can be observed with an oscilloscope and compared with the Timing Diagrams. In this way, timing and magnitude relationships can be measured against known specifications to confirm that the UniPak is performing to the device manufacturers' standards.

Since the UniPak generates a large number of waveforms and all calibration adjustments are accomplished in DC calibration, it is only necessary to observe waveforms for commonly used devices or those that are presenting yield problems.

#### 4.4.1 THE TIMING SEQUENCE

Waveform observation uses a software routine that generates programming waveforms for the data stored in system RAM. An oscilloscope trigger pulse is generated every address increment. This occurs after the reject pulse count has been reached for all the bits being programmed in the previous data word. The address is automatically reset to 0 when the maximum PROM address is reached, and incrementing continues.

The waveform observation procedure, paragraph 4.4.3, calls for filling RAM with data such that it is possible to observe address-change waveforms and bit-to-program waveforms. The procedure takes into account the device

type (VOL or VOH) so that for either type of PROM a bit-toprogram will appear on the same socket contact.

#### 4.4.2 THE TIMING DIAGRAMS

This manual contains a Timing Diagram for each device family programmed by the UniPak. Each Timing Diagram contains a set of waveform photographs that show critical programming parameters. The minimum and maximum parameter values are listed in the waveform variables tables on the diagrams. Other voltage and timing parameters are to be considered noncritical, with a tolerance of 10%.

Horizontal positioning of the waveforms is not critical and may vary slightly from the photographs. It can be adjusted on the oscilloscope to set convenient reference points; by taking into account any time-base variance, time comparisons can be made between photographs. (The time base is always the same for different waveforms in the same photograph.) Time-base and volts-per-division settings are printed on each photograph.

The waveform names are called out along the left edge of each photograph. Waveform names correspond to the pin names on the Pinout Charts, Figure 4-5. These charts tell which socket contacts to probe when observing the waveforms for a particular device pinout within a family.

The bit-to-program and A® waveforms shown are usually for 4-bit-devices. If an 8-bit pinout is chosen for observation, the time between A® transitions should be doubled to account for the 4 additional bits programmed at each word. Using the oscilloscope's single sweep mode is recommended for address observation, since one trigger pulse is generated for each address change.

#### NOTE

When RAM is filled with the data in Table 4-1 according to the procedure in the programmer manual, a bit-to-program may be observed on output  $0_4$  (4-bit device) or  $0_8$  (8-bit device), and a no-bit-to-program may be observed on output  $0_3$  (4-bit device) or  $0_7$  (8-bit device).

Detailed photographs are included to magnify rapid voltage changes or particular pulses in a pulse train. The delay time is printed at the bottom right of each detailed photograph.

#### 4.4.3 OBSERVATION PROCEDURE

This procedure, when used with a Timing Diagram, allows you to compare waveforms on the oscilloscope with the waveform photographs on the Timing Diagram for any type of device. The procedure is as follows:

 Refer to Table 1-1 to determine the Family and Pinout Codes, polarity, and technology of the selected device

#### NOTE

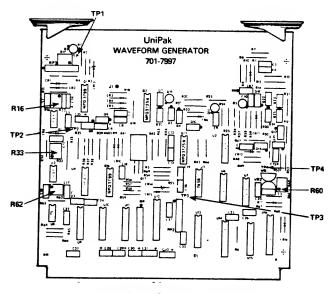

Polarity is indicated in the Family Code. Odd numbered families are VOL and even numbered families are VOH.

- 2. Initiate a Load operation.
- 3. Key in the Family and Pinout Codes.
- 4. Fill the programmer's RAM with programming data according to procedures given in the Operation section of the appropriate programmer manual. The correct data depends on the polarity and technology of the device. This data is listed in Table 4-1.

#### CAUTION

Remove all devices before entering calibration. Waveform generation may damage any device in the UniPak.

- 5. Enter Waveform generation at step 17. Refer to the programmer manual for the procedure.
- Prepare the oscilloscope by connecting TP1 on the Address and Data Driver board to the trigger input.
- 7. Ground the scope to the GND contact of the socket with its LED illuminated (Refer to Figure 4-5.)
- To observe individual waveforms, refer to Figure 4-5 under the Pinout Code number entered in step 3.
   The charts give the numbers of the socket contacts to probe when observing the waveforms on the Timing Diagram.

a. Waveform Generator, 701-7997

#### NOTE

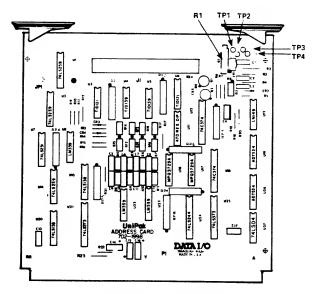

Paragraph 4.4.2 explains considerations helpful in setting up and interpreting the waveform displays.

Table 4-1. RAM Data for Waveform Observation

TYPE OF DEVICE	POLARITY	DATA IN EVERY ADDRESS
MOS PROMs	VOL	Hex 55
MOS PROMs	VOH	Hex AA
Bipolar PROMs	VOL	Hex 00
Bipolar PROMs	VOH	Hex FF

#### **4.4.4 ERASE WAVEFORMS**

The UniPak generates waveforms to erase many Electrically Erasable or Alterable PROMs. These waveforms may be observed by following the procedure in section 4.4.3 for programming waveform observations. Chip-erase waveforms can be viewed by entering calibration step 19, and byte-erase waveforms can be viewed in step 21. If step 19 is entered with other than an EEPROM family selected, it will result in an invalid family/pinout error (Error 30). If a family is selected that cannot be byte-erased, the UniPak will respond with Error BØ.

b. Address Card, 702-1998

#### **NOTES**

- Oscilloscope trigger point: TP1 on the Address Card, 701-1998.
   Trigger on the negative slope.
- Oscilloscope ground reference: GND contact on the socket with its LED illuminated.
- 3. The Pinout Charts, Figure 4-4, indicate which socket contact to probe to observe each waveform. Refer to the charts by Pinout Code. To observe a bit-to-program waveform, use the O<sub>4</sub> contact for a 4-bit PROM or O<sub>8</sub> for an 8-bit PROM. To observe a no-bit-to-program, use O<sub>3</sub> for a 4-bit PROM or O<sub>1</sub> for an 8-bit PROM.
- 4. Time and voltage bases, as well as any delay times, are printed on each photograph. The time base is the same for all waveforms in a photograph.
- 5. ▼ with a number indicates a waveform section expanded to show detail. The number refers to the detail photograph.

#### NOTES

- 1. Oscilloscope trigger point: TP1 on the Address Card, 701-1998. Trigger on the negative slope.
- 2. Oscilloscope ground reference: GND contact on the socket with its LED illuminated.
- 3. The Pinout Charts, Figure 4-4, indicate which socket contact to probe to observe each waveform. Refer to the charts by Pinout Code. To observe a bit-to-program waveform, use the O₄ contact for a 4-bit PROM or O₃ for an 8-bit PROM. To observe a no-bit-to-program, use O₃ for a 4-bit PROM or O₃ for an 8-bit PROM.
- 4. Time and voltage bases, cs well as any delay times, are printed on each photograph. The tir e is the same for all waveforms in a photograph.
- 5. ▼ with a number indicates a waveform section expanded to show detail. The number refers to the detail photograph.

- Oscilloscope trigger point: TP1 on the Address Card, 701-1998.
   Trigger on the negative slope.
- 2. Oscilloscope ground reference: GND contact on the socket with its LED illuminated.
- 3. The Pinout Charts, Figure 4-4, indicate which socket contact to probe to observe each waveform. Refer to the charts by Pinout Code. To observe a bit-to-program waveform, use the O₄ contact for a 4-bit PROM or O₃ for an 8-bit PROM. To observe a no-bit-to-program, use O₃ for a 4-bit PROM or O₁ for an 8-bit PROM.
- 4. Time and voltage bases, as well as any delay times, are printed on each photograph. The time base is the same for all waveforms in a photograph.
- ▼ with a number indicates a waveform section expanded to show detail. The number refers to the detail photograph.

- 1. Oscilloscope trigger point: TP1 on the Address Card 701-1998. Trigger on the negative slope.
- 2. Oscilloscope ground reference: GND contact on the socket with its LED illuminated.
- 3. The Pinout Charts, Figure 4-5, indicate which socket contact to probe to observe each waveform. Refer to the charts by Pinout Code. To observe a bit-to-program waveform, use the 04 contact for a 4-bit PROM or 03 for an 8-bit PROM. To observe a no-bit-to-program, use 03 for a 4-bit PROM or 04 for an 8-bit PROM.
- Time and voltage bases, as well as any delay times, are printed on each photograph. The time base is the same for all waveforms in a photograph.
- with a number indicates a waveform section expanded to show detail. The number refers to the detail photograph.

# SECTION 5 MAINTENANCE

### **5.1 CLEANING**

Inspect the UniPak regularly, inside and out, for accumulated dirt or dust. Dust on the circuit boards is most easily removed with a blast of compressed air. Dust and dirt can be wiped off the outside with a damp cloth. Do not use any abrasive cleaners!

### 5.2 INSPECTION

Periodic inspection of the UniPak can be a hedge against malfunction. A good time to schedule an inspection is before every calibration. Check cable connections, card seating, mounting of discrete components, etc., for shorts, opens or unstable continuity.

Particular care is required if heat-damaged components are found. It is important to find and correct the cause of overheating in order to prevent further damage.

## SECTION 6 TROUBLESHOOTING

### **6.1 INTRODUCTION**

The following information is an aid to interpreting malfunctions and locating hardware failures in the UniPak. System failures can be divided into two categories:

- · No system operation
- Persistent or intermittent test-stage errors (or poor yields)

These categories, covered in paragraphs 6.2 and 6.3, will direct the service technician to the portion of the circuitry implicated by test errors or unacceptable calibration results. Table 6-1 can be used to isolate the problem to a suspect board or component. Section 7, Circuit Description, and Section 8, Schematics, provide additional information useful in troubleshooting.

After successful troubleshooting, calibrate the UniPak, as described in Section 4.

### **6.2 NO SYSTEM OPERATION**

Perform the following steps if the system will not operate after installation of the UniPak. After completing each step, determine whether the problem still exists.

- Check for proper installation of the UniPak (refer to Section 2).
- Check all cables for proper insertion and orientation. Check the UniPak-to-programmer connector for bent pins.
- 3. Check power supplies.
- If steps 1 through 3 do not reveal the problem, contact your local Data I/O Service Center.

### 6.3 PERSISTENT OR INTERMITTENT TEST-STAGE ERRORS

Perform the following steps to isolate a system failure. After completing each step, determine whether the problem still exists.

- Check that the Family and Pinout Codes are correct for the device being programmed and that the device is inserted in the proper socket. Refer to Section 3.
- Substitute a good device to determine if a hardware problem exists.
- Check for proper installation of the UniPak (refer to Section 2).
- Check all cables for proper insertion and orientation. Check the UniPak-to-programmer connector for bent pins.
- 5. Perform a complete calibration. Note any voltages still falling outside the indicated limits, and then refer to the corresponding test number in Table 6-1 to locate the suspect board or component. Referring to the circuit description (Section 7) and the schematics (Section 8) may also prove helpful.
- Perform waveform observation tests. Note any waveform irregularities. Referring to the circuit description (Section 7) and the Schematics (Section 8) may prove helpful in determining the cause of any irregularities.
- Perform Measurement Chart Steps 15 and 16 for the device family presenting problems. (Refer to paragraph 4.3.4.)
- If steps 1 through 7 do not reveal the problem, contact your local Data I/O Service Center.

## SECTION 7 CIRCUIT DESCRIPTION

### 7.1 INTRODUCTION

This section defines the functions of the UniPak's principle hardware components. Each circuit-card assembly is depicted by a block diagram accompanied by a written description.

### 7.2 GENERAL ARCHITECTURE

### 7.2.1 THE LINK BETWEEN THE UniPak AND THE PROGRAMMER

The UniPak is controlled by the programmer's extended processor bus (J6), through the UniPak's mating connector. Pin functions of the extended processor bus are shown in Table 7-1.

The control software for the UniPak is located in PROM on the Memory Card (702-0045).

### 7.2.2 THE BUSES

The programmer's address bus, data bus,  $R/\overline{W}$  line and  $\overline{V \bullet \emptyset_2}$  line access the software on the Memory Card and control the gates and registers on the Waveform Generator (701-7997) and Address and Data Driver (701-1998) Cards. The UniPak's device bus gathers the programming waveforms produced by these cards and transmits them to the Socket Card (702-7995). Figure 7-1 shows the relationship among the buses.

Table 7-1. Pin Functions, Programmer's Extended Processor Bus (at J1-J3)

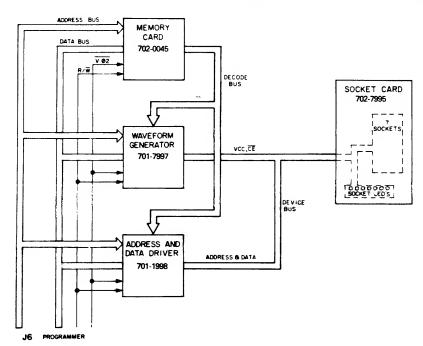

Figure 7-1. Block Diagram, UniPak Electronics

### 7.3 COMPONENT LAYOUT

Figure 7-2 shows the component layout of the UniPak. The principal components are described in paragraphs 7.3.1—7.3.5.

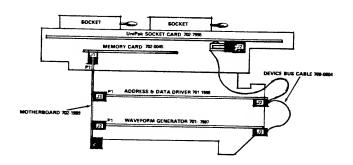

Figure 7-2. Principal Components of the UniPak

### 7.3.1 MOTHERBOARD

The motherboard accepts the signals and power supplies from J6 of the programmer and transmits them to

two identical 72-pin edge connectors and a 50-pin edge connector. See Figure 7-3 and schematic 008-1999.

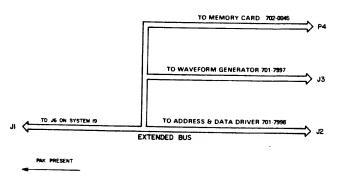

Figure 7-3. Block Diagram, UniPak Motherboard

### 7.3.2 WAVEFORM GENERATOR

The Waveform Generator provides all signals, including addresses and data, required for programming devices. These signals are generated by the blocks shown in Figure 7-4.

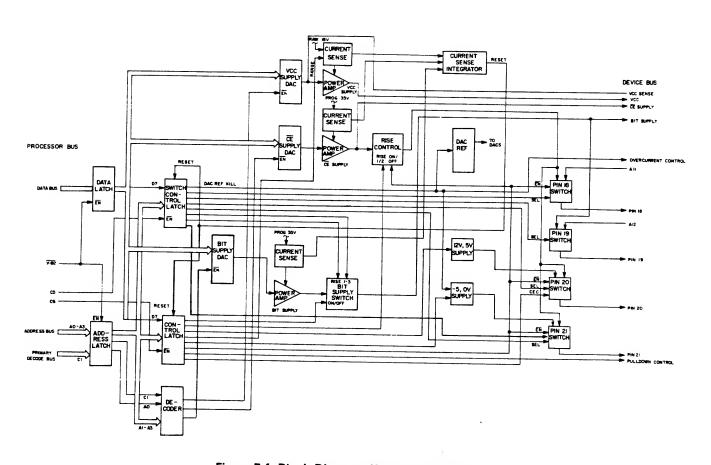

Figure 7-4. Block Diagram, Waveform Generator

Three major supplies are the Vcc Supply, the  $\overline{\text{CE}}$  Supply and the Bit Supply, which are used to generate the respective signals. Each supply is software-controlled via a D/A converter. All D/A converters obtain their reference voltage from the DAC Reference.

The Vcc waveforms are generated by writing appropriate DAC values from the software. The rise and fall times are fixed by the slewing rate of the op amp. Two overcurrent detectors are included, one for low currents and one for high currents (above 1 A). If a detector is activated, the control latch is reset; the DAC-Reference Kill output then causes the DAC Reference to go to zero, in turn causing all supplies to return to zero.

The Vcc Supply senses the Vcc voltage at the PROM socket via the Vcc-Sense line. This remote sensing compensates for all cable drops between the supply and the socket.

The  $\overline{\text{CE}}$  waveforms are generated by using the  $\overline{\text{CE}}$  Supply in conjunction with one of the pin switches. The voltage level is selected by writing the appropriate value to the  $\overline{\text{CE}}$  DAC. One of two rise times is selected by the Control Latch and rise-time control circuitry. Either the pin 18, 20 or 21 switch can be enabled by the Switch-Control Latch to output the high-level  $\overline{\text{CS}}$  voltage. Switches that are not enabled can output TTL levels.

Each pin switch consists of an emitter follower with the collector tied to the  $\overline{\text{CE}}$  Supply. A current source is provided for the base of each switch to charge the common rise-time capacitor. When the base is released, a linear ramp is generated which is truncated at the  $\overline{\text{CE}}$ -supply level. An NPN-transistor pulldown is included in the switch to provide a 20 V/µs controlled fall time. Logic circuitry prevents the pulldown and pullup circuits from being active simultaneously.

The Pin 21 Switch uses the same principles as the Pin 18 and Pin 20 Switches. However, a power amplifier output (-5/0 supply) provides the ground reference for the switch. For certain programming algorithms this amplifier output is brought to -5 V.

The Pin 20 Switch includes a pullup that is connected

to the +12/+5 V Supply, thus allowing the switch in the TTL mode to switch from 0 to 12 V as well as from 0 to 5 V. The +12/+5 V Supply consists of a monolithic regulator and a 5.1 V zener diode controlled by the Switch-Control Latch.

Signals to be applied to the data lines of a device are generated with the Bit-Supply signals and controlled by the Bit-Supply Switch. The Bit Supply is nearly identical to the CE Supply but has one less diode in the feedback path compensating for one less drop in the switch paths. The Bit-Supply Switch consists of an emitter follower, a current source and three rise-time-control capacitors. The collector of the emitter follower is connected to the Bit Supply; the base is connected to the current source and timing capacitor. The Control Latch can select the timing capacitor and also control the base of the switch. When the base is released, the output ramps linearly to the bit-supply level. The output on the Bit-Supply switch is sent to the Address and Data Driver Card and to the Pin 19 Switch.

Unlike the Pin 20, 21 and 18 Switches, the Pin 19 Switch consists of a simple PNP-saturating switch controlled by the Switch-Control Latch.

The Current-Sense Integrator smoothes the transient overcurrent pulses occurring from charging supply capacitors. When an overcurrent condition from the Vcc, CE, Bit or (0/-5 V) Supply exists for sufficient time, the Control Latch is reset, in turn causing the DAC Reference and the supplies to go to zero. The state of the Overcurrent-Control line can be read by the Address and Data Driver Card and used by the programmer to detect shorted devices. Table 7-2 gives the functions of the devicebus pins. The Data Latch buffers the data bus and holds data to satisfy the long DAC data-hold requirement. The Address Latch buffers the lower-order address lines and the primary decode bus. These buffered lines are then sent to the Decoder and the Address Latches. The Decoder provides decode signals to the DACs for the Vcc, CE and Bit Supplies. The Switch-Control Latch and the Control Latch receive their clocks from a decoder on the Address and Data Driver Card.

### 7.3.3 ADDRESS AND DATA DRIVER

The Address and Data Driver, diagrammed in Figure 7-5, provides the device address, device data, data loads and supply measurement capability of the UniPak.

The address drivers consist of addressable latches driving the device address bus. The addressable latches receive data from the most-significant-bit line of the data bus.

The Data-Switch Register drives PNP Data Switches which direct the output of the bit switch to the appropriate device-data line. The PNP switches are driven by current sources to provide a constant base drive at all bit-switch voltages.

The Data Sink Register drives the NPN Data Sinks directly. These data sinks are used to shunt to ground large programming currents. Device data is read via the Data Comparators and strobed to the processor bus via the Data Gate. The Comparators receive their reference voltage from

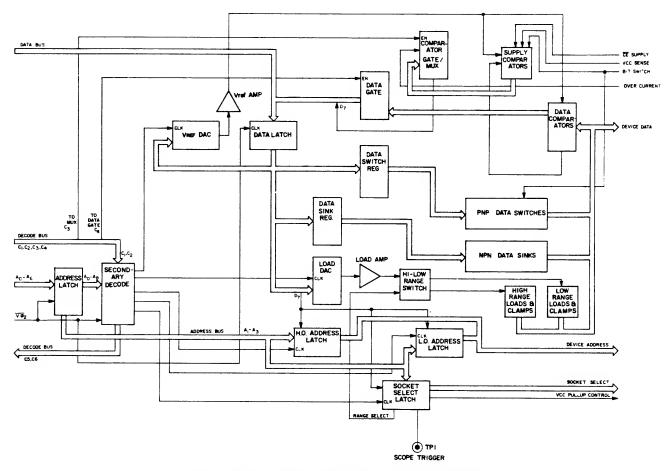

Figure 7-5. Block Diagram, Address and Data Driver Card

the VREF amplifier which is controlled by the VREF DAC. Loading of the device data bus can be controlled by the Load DAC, the Load Amplifier and the Hi/Low Range Switch. A voltage is developed by the Load Amp and applied to either the high-range or low-range resistor banks. The diode clamps limit the voltage applied by the load resistors to the data bus to approximately 5 V.

The Supply Comparators read the Vcc-Sense line, the  $\overline{\text{CE}}$  supply and the Bit-Switch line. The comparator Gate/Mux strobes the data from the Supply Comparators or Overcurrent-Read line to the most-significant-bit line of the data bus.

The Socket-Select Latch provides a control line for the Hi/Low Range Switch and control lines for the Socket Card.

The Data Latch buffers the data bus and holds data to satisfy the DAC requirements.

The Address Latch buffers low-order addresses for the Secondary Decoder. The decoder provides the appropriate signals for the DACs and registers as well as the latches on this card and on the Waveform Generator. The  $V \bullet \emptyset_2$  signal controls the timing of the various clock signals developed by the decoder.

### 7.3.4 UniPak SOCKET CARD

The UniPak Socket Card distributes to the device sockets the signals developed on the Address and Data Driver Card and the Waveform Generator. Refer to the block diagram, Figure 7-6. The device address lines connect directly to the device sockets; larger devices connect to more device addresses than smaller devices; diodeovervoltage protection on these lines prevents damage to the drivers on the Address and Data Driver Card.

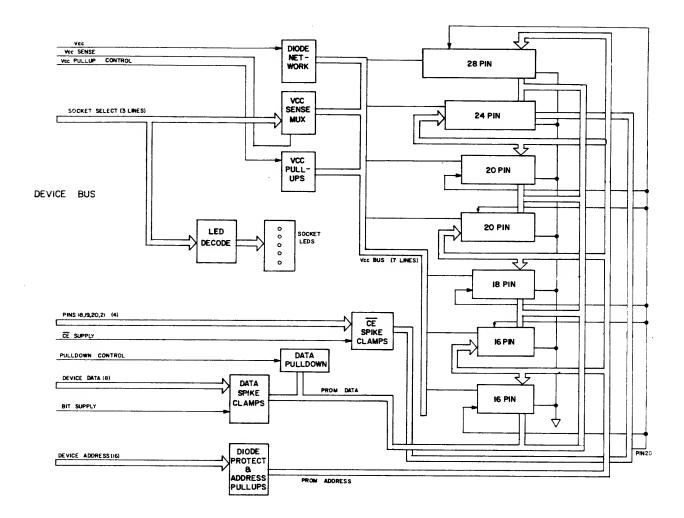

Figure 7-6. Block Diagram, UniPak Socket Card

The device-data bus connects directly to all sockets. Four-bit devices are connected to PD<sub>1</sub>-PD<sub>4</sub>. The data pulldowns consist of 1 k $\Omega$  resistors and a diode network. Data-Spike Clamps consist of diode networks and capacitor-resistor networks. The diode networks are used to clip overshoot on the data-line programming pulses. The capacitor network is charged by the Bit Supply so that the network does not absorb energy from the actual data-line programming pulses.

Pins 18, 19, 20 and 21 of the 24-pin device socket receive signals directly from the Waveform Generator via the corresponding pin switches. A spike-suppression network

similar to that used on the data lines is provided where the  $\overline{\text{CE}}$  Supply charges the R-C network. Vcc is applied to all sockets through seven diodes. Remote sensing of the voltage at the selected socket is provided by the analog switch of the Vcc-Sense Mux. When Vcc is brought to zero, the device's Vcc lines can be pulled up by the Vcc pullups. The Vcc-Sense Mux and a comparator on the Address and Data Driver Card are then used to read the Vcc voltage. If a device is in a socket the Vcc voltage will be above 2 V. If it is in backwards it will be below 1 V, and if no device is in the socket the voltage will approach 4 V.

The LED Decoder is used to light the LED below the selected socket.

### 7.3.5 UniPak MEMORY CARD

The UniPak Memory Card is shown in block-diagram form in Figure 7-7. PROMs which store the UniPak software are contained on the Memory Card. These PROMs connect to the address bus directly, and to the data bus through data buffers.

Two PROMs and a latch comprise the Primary Decoder. The PROMs connect to 12 higher-order address lines and the  $R/\overline{W}$  line. Outputs from the Primary-Decoder

Latch connect to the Secondary Decoder and also to secondary decoders on the Address and Data Driver Card and the Waveform Generator. A 1-of-8 decoder timed with  $\overline{V \bullet \emptyset}_2$  provides the secondary decoding for the software PROMs. Two additional lines from this decoder connect to the Address and Data Driver Card to provide the decode signals for the Data Gate and Comparator Gate/Mux. Additional outputs from the Primary Decoder enable the Data Buffer during all software-read operations and lower the Data-Gate-Enable line during any access of the UniPak.

### **APPENDIX 1**

### **ERROR CODES**

### NOTE

In the case of an error condition, be sure that the Family and Pinout Codes are correct for the PROM installed.

CODE	NAME	DESCRIPTION
21	Illegal-Bit Error	The device cannot be programmed due to already programmed locations of incorrect polarity.
23	First-Pass Verify Error	The device data were incorrect on the first pass of the automatic verify sequence during device programming.
24	Second-Pass Verify Error	The device data were incorrect on the second pass of the automatic verify sequence during device programming.
27	Insufficient RAM	Due to the value of the Begin RAM Address, there is insufficient RAM to program the device, or the total allotment of RAM resident is less than the word limit of the device.
30	No Programming Algorithm	Valid Family and Pinout Codes are not selected, or Family Code selection not followed by Pinout Code selection.
31	Excessive Current Drain	The operation stopped due to excessive current drain by a device.
32	Backwards Device	The operation stopped due to Vcc level test indicating a backwards device.
34		Number wrong/invalid family and pinout code in remote control.
35	Faulty Chip Select	The operation stopped due to data being present while a device is disabled.
38	Illegal Operation During Calibration	An illegal or invalid operation was attempted during calibration.
37	Socketing Error	Operation stopped due to a low Vcc level indication on sockets presumed to be empty. A device may be in the wrong socket, or 2 or more devices may be socketed simultaneously.
70	Faulty Bit Supply	The operation stopped due to a faulty bit supply. Do not use UniPak until repaired.
71	Faulty CS Supply	The operation stopped due to a faulty CS supply. Do not use UniPak until repaired.
72	Faulty Vcc Supply	The operation stopped due to a faulty Vcc. Do not use UniPak until repaired.
ВØ	Illegal Erase Operation	The operation stopped because an attempt was made to perform a byte-erase operation that the UniPak cannot byte erase. This error may appear when block limits are set or when accessing calibration step 21.

15043A 118th Avenue Edmonton, Alberta T5V 1H9 (403) 451-4893 To: All 29A Programmer Users Subject: 64K x 8 Dynamic RAM

November, 1983 FB #021-0209

This Field Bulletin affects 29A Programmers with the following part numbers:

990-0029-065 990-0029-066 990-0029-067 990-0029-068

The part number is located on the serial number sticker on the bottom of the unit.

Some 64K x 8 Dynamic RAM Boards have exhibited a marginal timing problem in the RAM refresh circuitry. This timing problem results in an intermittent RAM data error "64". To correct this problem, a new refresh timing PAL has been developed.

If you have one of the units listed above and are experiencing the "error 64" problem, contact your local Data I/O Service Center for a free update kit.

Subject: 16-Bit Development System Data Formats

November, 1983 FB #021-0210

This Field Bulletin affects Model 29A Programmers with firmware configuration numbers "088A" or "86F1." To display the system's firmware configuration number, enter: SELECT-B2-START.

When receiving 16-bit Data Formats (Intel, Motorola, T.I. and H.P.), address fields outside the desired block of data are not being translated properly by the affected units. If you have one of the affected units, a firmware update can be obtained from your local Data I/O Service Center at no charge.

To: All PLDS Users Subject: 1. LogicPak 303A

PALASM Design Adapter 303A-100
 Signetics IFL Design Adapter 303A-101

November, 1983 FB #021-0211

### 1. LogicPak 303A V02.

This Field Bulletin applies only to the V02 version of the LogicPak™. To determine the version number of the pak, check the label under the rear edge of the pak.

When using the programmer serial port for control of the pak or for data transfer with <u>odd</u> or <u>even</u> polarity selected, the V02 version LogicPak<sup>TM</sup> would give invalid responses.

If you have a V02 version LogicPak™, contact your local Data I/O Service Center for a firmware update at no charge.

### 2. PALASM Design Adapter 303A-100 V02

This Field Bulletin applies only to the V02 version of the PALASM design adapter. To determine the version number of the adapter, check the label under the front edge or, with the adapter installed on the LogicPak™ in the programmer, enter SELECT CODE "EF" "START" and observe the programmer display. If it displays configuration number "EC4E," it is a V02 adapter.

When using the programmer serial port for remote control or data transfer with <u>odd</u> or <u>even</u> parity selected, the V02 version PALASM design adapter would give invalid responses.

If you have a V02 version PALASM design adapter, contact your local Data I/O Service Center for a firmware update at no charge.

### 3. Signetics IFL Design Adapter 303A-101 V02

This Field Bulletin applies only to the V02 version of the Signetics IFL Design Adapter. To determine the version number of the adapter, check the label under the front edge or, with the adapter installed on the LogicPak<sup>TM</sup> in the programmer, enter SELECT CODE "EF" "START" and observe the programmer display. If it displays configuration number "3AD2," it is a V02 adapter.

When using the 82S158/159 FPLS devices, the firmware in the V02 adapter did not properly generate or translate the Signetics ASCII Logic Format (the JEDEC format operates correctly). If you have a V02 IFL Design Adapter, contact your local Data I/O Service Center for a firmware update at no charge.

Attached is an updated copy of the logic diagram for the 82S158/159 FPLS devices. Use it to replace the one in your 303A-001 Signetics IFL P/T Adapter manual. The earlier one had the wrong fuse numbers assigned to the "EA" and "EB" fuses.
